) Category:1956 births Category:Living people Category:American music video directors Category:American photographers  
Category:Place of birth missing (living people)[Absence of consanguinity in Switzerland. Physiological, clinical and legal aspects]. Consanguine marriage is a practice that generally in Switzerland has been abandoned by law in all the most recent editions. This practice is physiologically very harmful: It has consequences on homo genus, hetero genus, phenotypic and neural sexual dimorphism. It also has many consequences in the legal sphere. The Swiss law gives specific protection to the child, and also to the parents that have had the responsibility for the child, and to their descendents. The Swiss law assumes that in the absence of sexual contact, the child and the pregnant woman are entirely unrelated, and that the mother therefore does not bear the risk of being declared sterile, nor the risk of being called to bear the paternity of a child that she does not want. This

theoretical protection is insufficient: in reality, in the case of a child born to a mother whose father was adopted out of her family, the mother may be forced to bear the paternity of the child. Comparative evaluation of a simple model for rapid bedside assessment of urea production rate in critically ill patients. Urea production rate (URR) is used in estimating the maximum nitrogen load in critically ill patients. We tested a simple model for determining URR, which is based on the calculation of the ratio between the amount of nitrogen secreted in the urine and the nitrogen intake. The model was compared with the classical method based on the collection of urine specimens over 4 days. The study was conducted in two phases. First, during a 30-h period, URR was calculated by the two methods in eight patients, and interindividual variability was determined. In a second phase, after a 60-h fast, URR was calculated in a further 30 patients to assess the impact of fasting on URR and on the agreement between the two methods. URR was calculated as  $5.6 \pm 0.9 \text{ g dl}^{-1} \times \text{h}^{-1}$  (mean  $\pm$  SD) by the classical method, and  $4.4 \pm 1.4 \text{ g dl}^{-1} \times \text{h}^{-1}$  by the model. The difference between the two methods was significant (p
